Kroes is an aviation practitioner and educator with more than 35 years of experience in the field. He holds or has held several FAA certifications, including Airframe and Powerplant Mechanic, Inspection Authorization, Designated Mechanic Examiner, Designated Engineering Representative, and Commercial Pilot. Mr. Kroes has worked for some of the top aviation companies, including Raytheon and Allied Signal, and spent 25 years as a professor and department head at Purdue University. Recognized as a leading expert on FAA technician certification, he authored a comprehensive study funded by the FAA. This study was used to develop new FAA technician certification content and guidelines.

I'm writing this review not from the perspective of an Airframe and Powerplant student, but rather from the perspective of a pilot. I found this book to be very informative and well worth reading to expand a pilots knowledge of engine operating techniques. While it's probably a bit beyond what is required, I can't stress enough to students and fellow pilots that the more they know about the heart of their airplane. The knowledge presented in this book is applicable to nearly all aircraft engines in operation, in fact I can't think of one that isn't really covered except a scram jet.

The diagrams are in black and white and there is little useful to a man trying to build his own jet liner. No, just the fact that the pictures are black and white makes it difficult to see fine detail.

Exactly what I wanted at a descent price and delivered promptly.

Great book, and useful for engineers to know the knowledge not learned in school.

Good book

would be better if it had higher quality pictures, more color pictures, less page jumping for diagrams and pictures for examples.

Meets class required text Thanks

Excellent condition
